RESEARCH

General Research Interests

My research is largely focused on the geochemistry of hydrothermal reactions. I carry out experimental and field investigations pertaining to fluid-mineral equilibria, mass transport of metals and volatile gases and multi-phase behavior in crustal fluids, both on Earth and other planetary bodies. Specific studies currently include: the chemical evolution of deep-sea hydrothermal vent fluids and the impacts on associated biota, the abiotic synthesis and stability of organic compounds, potential reservoir effects related to geological carbon sequestration, partitioning of tracer gases between brines and supercritical CO₂, the effect of salinity and matrix cations on the mass transfer of transition metals, the effects of fluid chemistry on sub-critical crack growth in stressed materials/minerals, and competitive sorption of metals in clay minerals.
